

FEATURES

- Ultra Low Noise Output
- High Output Voltage Accuracy
- Guaranteed 150mA Output
- Maximum Output Voltage of Adjustable type is 8.5V.
- Low Quiescent Current
- Low Dropout Voltage
- Extremely Tight Load and Line Regulation
- Very Low Temperature Coefficient
- Current and Thermal Limiting
- Reverse-battery Protection
- “Zero” off-mode Current
- Logic-controlled Enable
- Moisture Sensitivity Level 3

APPLICATION

- Cellular Telephones
- Laptop, Notebook, and Palmtop Computers
- Battery-powered Equipment
- PCMCIA V_{CC} and V_{PP} Regulation/Switching
- Consumer/Personal Electronics
- SMPS Post-regulator/DC to DC Modules
- High-efficiency Linear Power Supplies

DESCRIPTION

The TJ5205 is an efficient linear voltage regulator with ultra low-noise output, very low dropout voltage (typically 17mV at light loads and 165mV at 150mA), and very low ground current (600 μ A at 100mA output).

The TJ5205 offers better than 1% initial accuracy. Designed especially for hand-held, battery-powered devices, the TJ5205 includes a CMOS or TTL compatible enable/shutdown control input. When shutdown, power consumption drops nearly to zero.

Regulator ground current increases only slightly in dropout, further prolonging battery life.

Key TJ5205 features include a reference bypass pin to improve its already excellent low-noise performance, reversed-battery protection, current limiting, and over temperature shutdown.

The TJ5205 is available in fixed and adjustable output voltage versions in SOT-23-5 PKG and SOP-8PP PKG. And adjustable type's maximum output voltage is 8.5V.

- Note 1. Exceeding the absolute maximum rating may damage the device.
- Note 2. The device is not guaranteed to function outside its operating rating.
- Note 3. The maximum allowable power dissipation at any T_A (ambient temperature) is P_{D(max)}=(T_{J(max)}-T_A)+ θ_{JA}. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. The θ_{JA} of the TJ5205-XX (all versions) is 220°C/W mounted on a PC board
- Note 4. The TJ5205-ADJ has V_{REF}=1.242V±1%, but minimum output voltage for TJ5205-ADJ must be above V_{OUTmin}=2.0V.
- Note 5. Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.
- Note 6. Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1mA to 150mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.
- Note 7. Dropout Voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.
- Note 8. Ground pin current is the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the load current plus the ground pin current.
- Note 9. Thermal regulation is defined as the change in output voltage at a time "t" after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a 150mA load pulse at V_{IN} = 16V for t = 10ms.
